

SCBA Canister and 40mm Adapter Use

- A1 and A2 have Infection Control Kits, which are red bags located in the drivers side rear compartment. These contain Tyvek suits, gloves, duct tape, and boots for hazardous conditions requiring protection.
- As part of this ensemble, we have added adapters and canisters to use with your SCBA mask for respiratory protection during long term operations, or times when an SCBA is not needed, but respiratory protection is.

40mm Adapter – This piece clips into the mask, which then allows a canister to be screwed on and used

Enforcement Canister – This should be used for protection from biological threats for extended periods and most chemicals for shorter periods (This should be used unless there is a threat of chem or bio weapons)

CBRN Canister – To be used any time there is a threat of a chemical or biological weapons release, but will also protect against normal biologicals and chemicals

See Paul or Derek with any questions, thanks.
